

6-Month Forward Recession Risk (1990–Present)

● Historical Recessions ● Recession Probability (Model)

1.14%

Current Recession Risk (Next 6 Months)

Model-based recession risk indicator, trained on credit spreads (BAA10Y), broad economic activity (CFNAI), labor market claims (ICSA), and industrial production (INDPRO). The model estimates the probability of a Sahm Rule recession signal within the next 6 months.

Note: this is a vulnerability measure, not an event predictor — it reflects how exposed the economy currently is to a shock, not whether a shock (geopolitical, pandemic, financial) will occur. High readings warrant closer liquidity and credit risk monitoring; low readings do not guarantee stability against an external shock (e.g. COVID-19, Mar 2020).
